

## **JAZZ™ Passer: More Band Innovation**

**I**MPLANET engineers have developed the new JAZZ™ Passer system to offer surgeons new options for passing bands, particularly in degenerative indications. JAZZ™ Passer system has just obtained the CE marking and 510K registration required for commercialization in the US market.

**JAZZ™ Passer is a range of instruments and a new braid, JAZZ™ Passer Band, with an opening at the distal tip. The Passers facilitate passage of the band around all anatomical structures of the posterior spine, as well as in sub-laminar, sub-transverse process, and inter-spinous fashions.**

**Its use is simple: once the passer has been passed under the anatomical structure, the band is hooked onto the tip of the Passer. Lowering the handle allows the progression of the band around the anatomical structure. And that's it! The only thing left to do is pass the band back through the pre-selected connector, JAZZ™ Band, JAZZ™ Claw, or even JAZZ™ Lock.**

**Without a doubt, JAZZ™ Passer will help ease the use of band connectors of the JAZZ™ Platform for a great number of users, in particular in the degenerative domain.**
